The 13th International Congress of Shoulder and Elbow Surgery

May 18th (Wed) ~ 20th (Fri), 2016 / ICCJEJU, KOREA

Arthroscopic fixation with knotless double row construct for displaced greater tuberosity fractures

P. Croutzet¹, V.Costil², JD Werthel², P. Massin², P.Boyer²

1-Union Clinic, Toulouse, France

2-Bichat Hospital, AP-HP, Paris Diderot University

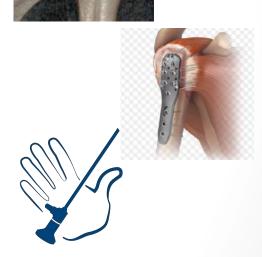

Introduction Greater Tuberosity Fractures

Common fractures : 20% proximal humerus fractures.

Oftenly associated with a shoulder dislocation (20-30%)

- ◆Surgical when displaced >5-10mm
- ◆Surgical options:
 - Open surgery : plate, screws and wires
 - Arthroscopic technique

Purpose

To evaluate the outcome after greater tuberosity fractures operated under arthroscopy using knotless suture-bridge (double row) construct with tapes

Materials and Methods

13 patients (13 shoulders)

- Mean age: 39 years (±13.2)
- 11 ♂ / 2 早
- 10 right / 3 left
- 13 displaced GT fractures (systematic CT –Scan)
- 5/13 after shoulder dislocation
- Same arthroscopic fixation
- One single surgeon

Materials and Methods: Surgical Procedure

- 1. General anesthesia / Beach chair position /5 portals/
- Direct exploration of the joint Benefits after shoulder dislocation

Possibility to perform a Bankart-repair if needed

3. Exploration of the fracture

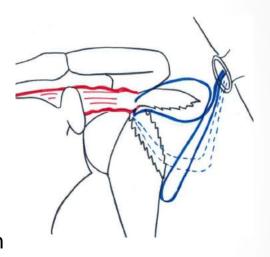

Materials and Methods: Surgical Procedure

4. Reduction and fixation with anchor suture bridge

- 2 medial anchors
 - Swivelock 4,5 mm, Arthrex®, Naples, FL
 - Pre-loaded with 2mm-wide tapes (Fibertape, Arthrex®)

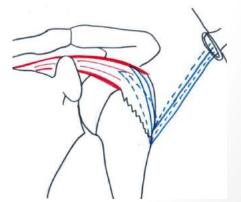

- 2. Passing the tapes through the supraspinatus tendon
- 2 lateral anchors
 - Swivelock 4,5 mm, Arthrex®, Naples, FL
 - Reduction was obtained after tensioning the tapes

Materials and Methods: Rehabilitation & Evaluation

- I- Rehabilitation, same as for rotator cuff repair:
 - First 3 weeks:
 - Pendulum exercises + passive elevation and external rotation
 - •At 3 weeks:
 - active-assisted ROM exercises
 - •At 6 weeks:
 - active ROM exercises

II -Evaluation:

- Clinical and radiographical examinations
 - After 6 weeks, 3 months, 6 months and 1 year
- Constant score at regular follow up
- All complications were recorded

Outcomes

- Mean follow-up: 28 months (17-32)
- Mean delay trauma-surgery : 5 days
- Constant score: 82 (+/- 5.6)
 - AE 140°
 - Pain 12.6(+/-2.1) /15
 - Daily activity 8.3 (+/-1.2) /10
 - Muscular strength 16 (+/-2.1) /25
- Pain evaluation: EVA 2.3 (+/-1.2)
- Complications :
 - -2 CRPS
 - -1 peroperative conversion to open: (failed lateral row in osteoporotic bone)
- Bony union in all cases after 3 months

Discussion

Benefits of this arthroscopic suture bridge fixation:

- Osteoporotic bone increases the risk of displacement of the anchors
- Technically demanding: exposure, management of bleeding...

- Minimizes dissection and decreases morbidity
- Adapted in case of comminution and small fragments
- Treatment of associated lesions (SLAP, cuff tear, Bankart lesion)
- No need for systematic hardware removal

Thank You
